

Neurobiology and Anatomy - Beierlein Lab

A postdoctoral position is available to study synaptic plasticity in neocortical microcircuits, using electrophysiological and optical techniques in brain slices. Research in the lab will focus on the functional properties of chemical and electrical synapses, the role of astrocytes in modulating synapse dynamics and retrograde signaling via endocannabinoids. Further information is available at <http://nba.uth.tmc.edu/resources/faculty/members/beierlein.htm>.

Candidates should hold a PhD, MD or equivalent degree and have experience in cellular physiology and/or imaging techniques. To apply, send full CV, a brief outline of current research and the names and contact details of three academic referees to
